The nucleotide sequences are useful as source of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AAZ33891 to AAZ43338, and AAY41685 to AAY41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 730

                                                                                                        AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polyneptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bioactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide provide specific targeting of bioactive molecules to cells, AAC78600 to AAC78987 represent PCR primers and probes used in the isolation of the PRO polynucleotide sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ashkenazi AJ

                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes an isolated antibody (Ab) that binds to come of the human proteins (P) designated PRO213, PRO130, PRO1449, CC PRO737, PRO324, PRO351, PRO362, PRO615, PRO531, PRO338, PRO3644, PRO618, CC PRO772, PRO703, PRO792 or PRO474. The Ab can be used in compositions and composition in mammals, including humans. Genes and polypeptides composed by them, that are amplified in the genome of a tumour cell, can be identified and are useful targets for the treatment and prevention of cortain cancers and may be used to monitor tumour treatment. Compounds that inhibit the expression or activity of the identified polypeptides can be identified and used as antagonists. Benign or malignant tumours, composition of the human proposition of the probes and PCR primers used in the isolation of the human PRO sequences. AAC58225 to AAC58241 and CC AAB24041 to AAB24056 represent human PRO polymucleotide and protein and composition of the present invention of the present invention of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel human fatty acid transporter, PSEC67 (AAB60388), and to cDNA encoding it (AAF27417). PSEC67 is responsible for the uptake of oleic acid into cells. The invention also relates to vectors and host cells comprising a PSEC67 nucleic acid; the recombinant production of PSEC67; an antibody against PSEC67; methods of screening for compounds which can regulate the uptake of long-chain fatty acids into cells; and the compounds thus identified. The PSEC67 protein and the gene encoding it are useful as targets for the treatment or prevention of diseases associated with defective metabolism of long-chain fatty acids. Such diseases include cardiomyopathy, skeletal muscle discorders, or renal failure. PSEC67 nucleic acids may also be used in gene therapy for such discorders. The present sequence represents PSEC67
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 730 AA;

New fatty acid transport proteins (FATPs) useful for the manufacture medicament for treating obesity, diabetes and heart disease.

Claim 31; Fig 112; 287pp; English.

The present invention provides the protein and coding sequences of fatty acid transport proteins (FATPs) from a number of species, including FATP1, FATP2, FATP2, FATP4, FATP5 and FATP6 from the human, FATP1-FATP5 from the mouse, FATP3 and b from C. elegans, and FATP from Aspergillus nidulans, Drosophila, zebrafish, Magnaporthe grisea, Mycobacterium tuberculosis and Cochliobolus heterostrophus. The FATP from M. tuberculosis can be used to identify inhibitors which can then be used to treat TB. That from M. grisea (also known as rice blast fungus) can be used to develop anti-fungal agents capable of preventing infection of rice. Those from the human can be used to develop treatments for diabetes, heart disease, obesity, hyperlipidaemia and weight control. The present sequence is one of the sequences described in the exemplification of the invention ght control. The exemplification

New secre secreted as PRO, useful injury, and transmembrane nucleic acids and polypeptides, designated ul for treating inflammation, organ failure, atherosclerosis, ry, infertility, birth defects, premature aging, AIDS, or

12; Fig 39; 453pp; English.

The invention describes an isolated nucleic acid (I) comprising, is at least 80 % sequence identity to, or the full-length coding of, any of 118 300-2100 nucleotide sequences, which encodes its corresponding PRO polypeptide selected from 118 100-700 amino aci sequences, all given in the specification. The nucleic acids and o acid or which

The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typing. This is the amino acid sequence of a novel human
                                                                                                                                                                                         541
                                                                                                                                                                                                                                                                                                                                                                                                                                                      301

                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel method for determining if a nucleic acid coil is a marker for a predetermined phenotype/cell type of interest from a collogical species. The method comprises performing a global comparison of a group of expressed sequence tags (ESTs) known to be expressed in the control of expressed sequence tags (ESTs) known to be expressed in the control of interest with all ESTs expressed in normal tissue control of interest. A method of the invention is useful for collection or cell type of interest from a biological species, preferably control or ruman. The cell type of interest is an abnormal cell such as a tumour cell, and the predetermined phenotype is a stress induced control in also useful for determining the progression of colon cancer in a human, for detecting a tumour cell, and for regulating or cancer in a human, for detecting a tumour cell. An antibody of the invention is cuseful for detecting the absence or presence of peptides encoded by tumour-associated markers. A polypeptide of the invention is useful as an immunogen for vaccinating an animal. The present sequence represents a coll type of the invention of the invention is colon colon control of the invention of the invention is colon colon colon colon control of the invention is colon colo

CC The invention relates to an isolated secreted and transmembrane CC polypeptide, designated as PRO polypeptide. The PRO polypeptide is useful CC in PRO polypeptide detection methods. The PRO polypeptide is useful for CC linking a bioactive molecule to a cell. The PRO polypeptide is useful for CC antibody against it is useful for modulating a biological activity of a CC cell. The PRO polypeptide is useful in industrial applications including pharmaceuticals, diagnostics, biosensors and bioreactors. The PRO polypeptide is useful in industrial applications including CC pharmaceuticals, including set thrombolytic agent, interferon, CC interleukin, erythropoietin, colony stimulating factor and other cytokines. The PRO polypeptide is useful for treating disease such as concer e.g. colorectal carcinoma, apoptosis related conditions e.g. AIDS, CC amportrophic lateral sclerosis; inflammatory disease e.g. Alzheimer's disease, CC amportrophic lateral sclerosis; inflammatory disease e.g. hypertension and CC myocardial ischaemia; kidney disease e.g. hypertension, bronchial CC atthat; gastrointestinal disorders e.g. gastric ulcer and inflammatory CC bowel disease; reproductive disorders e.g. premature labour and CC acid sequence of a PRO polypeptide of the invention. Note: The sequence CC data for this patent did not form part of the printed specification but come obtained in electronic format directly from USPTO at composition of the compart of the printed specification but composition is a proposition of the compart of the printed specification but capture in the composition of the compart of the printed specification but capture in the composition of the compart of the printed specification but capture in the composition of the compart of the printed specification but captured the composition of

The present invention relates to the isolation of novel human PRO CC polypeptides, and the polynucleotide sequences encoding them. The PRO CC polypeptides are secreted and transmembrane proteins. The PRO CC polypeptides are useful for detecting other PRO polypeptides, for linking CC bioactive molecules to cells expressing PRO polypeptides, for modulating CC biological activities of cells expressing PRO polypeptides, and for for cidentifying agonists or antagonists. The bioactive molecule maybe a CC toxin, radiolabel or antibody, and causes apoptosis or death of the cell. The PRO polypeptides are useful for treating immune disorders, diabetes CC or hyper- or hypo-insulinaemia, cardiac insufficiency, nervous system CC disorders, kidney disorders, bone and cartilage disorders or arthritis, tumours, and wound healing. The polypucleotide sequences encoding PRO collegeptides are useful as hybridisation probes, in chromosome and gene CC mapping, in the generation of antisense RNA and DNA, in the preparation CC polypeptides, for generating transgenic animals or knockout CC and in gene therapy. ABUG1071-ABUG1164 represent the human PRO CC polypeptides of the invention. Note: The sequence data for this patent CC sorders users COV/nsipolitic format directly from the USPTO web site at CCC conditions and electronic format directly from the USPTO web site at was obtained in electronic format di seqdata.uspto.gov/psipsDIDEntry.html

The invention relates to a new isolated nucleic acid molecule comprises a CC sequence with at least 80% identity to: (a) a nucleotide encoding any of 94 PRO polypeptides whose sequences are fully defined in the CC specification; or (b) any of 94 nucleotide sequences fully defined in the CC specification; or the full length coding sequence of any these 94 cnucleotide sequences. Also included are an isolated PRO polypeptide nucleotide sequences cited above (or an isolated PRO polypeptide polypeptide at least 80% amino acid sequence identity to: (a) an amino acid sequence compared to any of the PRO polypeptide peptide; or (c) an extracellular domain of the PRO polypeptide, or (c) an extracellular domain of the PRO polypeptide, with or CC polypeptide; or (c) an extracellular domain of the PRO polypeptide, with or CC acid molecule, a chimaeric molecule comprising the PRO polypeptide, with or CC polypeptides, a chimaeric molecule comprising the PRO polypeptide, with or CC diagnostics, biosensors or bioreactors. These are particularly useful for cheteting or treating e.g. malignancies or cancers (e.g. ovarian cancer, sarcoma, leukaemia or lymphoma), inflammatory disease, renal disease, arthritis, immune-mediated alopecia, stroke, encephalitis, hepatitis, or multiple sclerosis in mammals. The PRO polypeptides are useful in drug screening, particularly as targets of the charaction of the presence of these diseases, and in the diagnostic determination of the presence of these diseases, and in the diagnostic contentification. The PRO genes are useful as hybridisation probes, or for calso be used in gene therapy, particularly for replacing a defective gene. The present sequence represents a PRO polypeptides are
                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes an isolated secreted and transmembrane (PRO) polypeptide (I). PRO337 polypeptide is useful for detecting PRO4993 polypeptide in a sample, and vice versa. PRO725, PRO700 and PRO739 are useful for detecting PRO1559 polypeptide in a sample, and PRO1559 is useful for detecting PRO725, PRO700 and PRO739 in a sample. PRO4993 is useful for linking a bioactive molecule to a cell expressing a PRO337 polypeptide, and PRO337 is useful for linking a bioactive molecule to a cell expressing a PRO4993 polypeptide. PRO4993 is useful for linking a bioactive molecule to a cell expressing a PRO735, PRO700 and PRO739
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated PRO polypeptides for example extracellular, secreted and membrane bound proteins, useful for modulating the biological activities of cells and for treating, for example diabetes, cancer, rheumatoid arthritis, and hearing loss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 2003-521814/49.

                                                                                                                                                                                                               The invention describes an isolated, secreted and transmembrane polypeptide, termed PRO polypeptide (I). (I) is useful for detecting PRO4993, PRO337, PRO1559, PRO725, PRO700 or PRO739 polypeptide, and for linking a bioactive molecule to a cell expressing the above polypeptides. The bioactive molecule is a toxin, radiolabel or an antibody and causes cell death. (I) is useful as therapeutic agent, in medical and industrial applications e.g. for treating neuropathy, especially peripheral neuropathy, diabetic peripheral neuropathy, AIDS-associated neuropathy, Charcot-Marie-Tooth disease, Refusum's disease, Abetalipoproteinaemia, Tangier disease, Krabbe's disease, Metachromatic leukodystrophy, Fabry's
